Icom Inc.

INTRODUCTION

This service manual describes the latest service information for the **IC-207H** VHF/UHF FM TRANSCEIVER at the time of publication.

MODEL	VERSION	SYMBOL
IC-207H	Europe	EUR
	Italy	ITA
	U.S.A	USA
	Asia	SEA

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1150000760 IC SC-1091 IC-207H MAIN UNIT 5 pieces
8810009020 Screw FH M2.6 x 5 ZK IC-207H Bottom cover 10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 50 dB to 60 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 3 DISASSEMBLY INSTRUCTIONS

- ① Push the release button (A), then detach the control panel.
- ② Unscrew 4 screws (B) from bottom cover.
⚠ WARNING! NEVER attempt to open the cover using your finger nails, this may result in injury.

- ③ Disconnect the connector (C) from J4.
- ④ Disconnect the connector (D) from J1 and remove the speaker.
- ⑤ Unscrew 3 screws (E) and remove the shield case.
- ⑥ Unscrew 1 screw (F) from IC4.
- ⑦ Unsolder 3 points (G) from the antenna connector.
- ⑧ Unscrew 7 screws (H).

- ⑨ Remove the MAIN unit from the chassis.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 DUPLEXER CIRCUIT

The transceiver has a duplexer (low-pass and high-pass filters) on the first stage from the antenna connector to separate the signals into VHF and UHF signals. The low-pass filter (L1–L3, C1–C3) is for VHF signals and the high-pass filter (L20, L21, C75–C77) is for UHF signals. The separated signals are applied to each RF circuit.

4-1-2 VHF ANTENNA SWITCHING CIRCUIT

The antenna switching circuit functions as a low-pass filter while receiving. However, its impedance becomes very high while transmitting by turning ON diodes (D7, D8). Thus transmit signals are blocked from entering the receiver circuits. The antenna switching circuit employs a $1/4 \lambda$ type diode switching system. The passed signals are then applied to the RF amplifier circuit.

4-1-3 VHF SQUELCH ATTENUATOR CIRCUIT

The current flow of the antenna switching circuit (D7, D8) is controlled by the [SQL] control via Q111. When the [SQL] control is rotated clockwise deeper than 12 o'clock, the current of D7 and D8 is increased. In this case, D7 and D8 act as an attenuator (max. 10 dB).

4-1-4 VHF RF CIRCUIT

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signal from the antenna switching circuit passes through a tunable bandpass filter (D10, L14, L15) where the object signals are led to the RF amplifier circuit (Q3).

The amplified signals at Q3 are then applied to the 3-stage tunable bandpass filter (D11–D13, D127, L16–L18) to suppress unwanted signals. The filtered signals are then applied to the 1st mixer circuit (Q4).

D10–D13 employ varactor diodes, that are controlled by the PLL lock voltage, to track the band pass filters. The PLL lock voltage is amplified at the DC-amplifier circuit (IC29, D129) and then applied to these diodes.

4-1-5 VHF 1ST MIXER CIRCUIT

The 1st mixer circuit converts the received signals to a fixed frequency of the 1st IF signal with a 1st LO (V-VCO output) frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the mixer.

The signals from the RF circuit are mixed with the 1st LO signal at the 1st mixer circuit (Q4) to produce a 46.05 MHz 1st IF signal.

4-1-6 1ST IF CIRCUIT

The 1st IF signal from either the VHF or UHF 1st mixer circuit is applied to a pair of crystal filters (FI2) to suppress out-of-band signals via a matching circuit (L38, C129). The filtered signal is amplified at the IF amplifier (Q54) and is then applied to the 2nd mixer circuit (IC10).

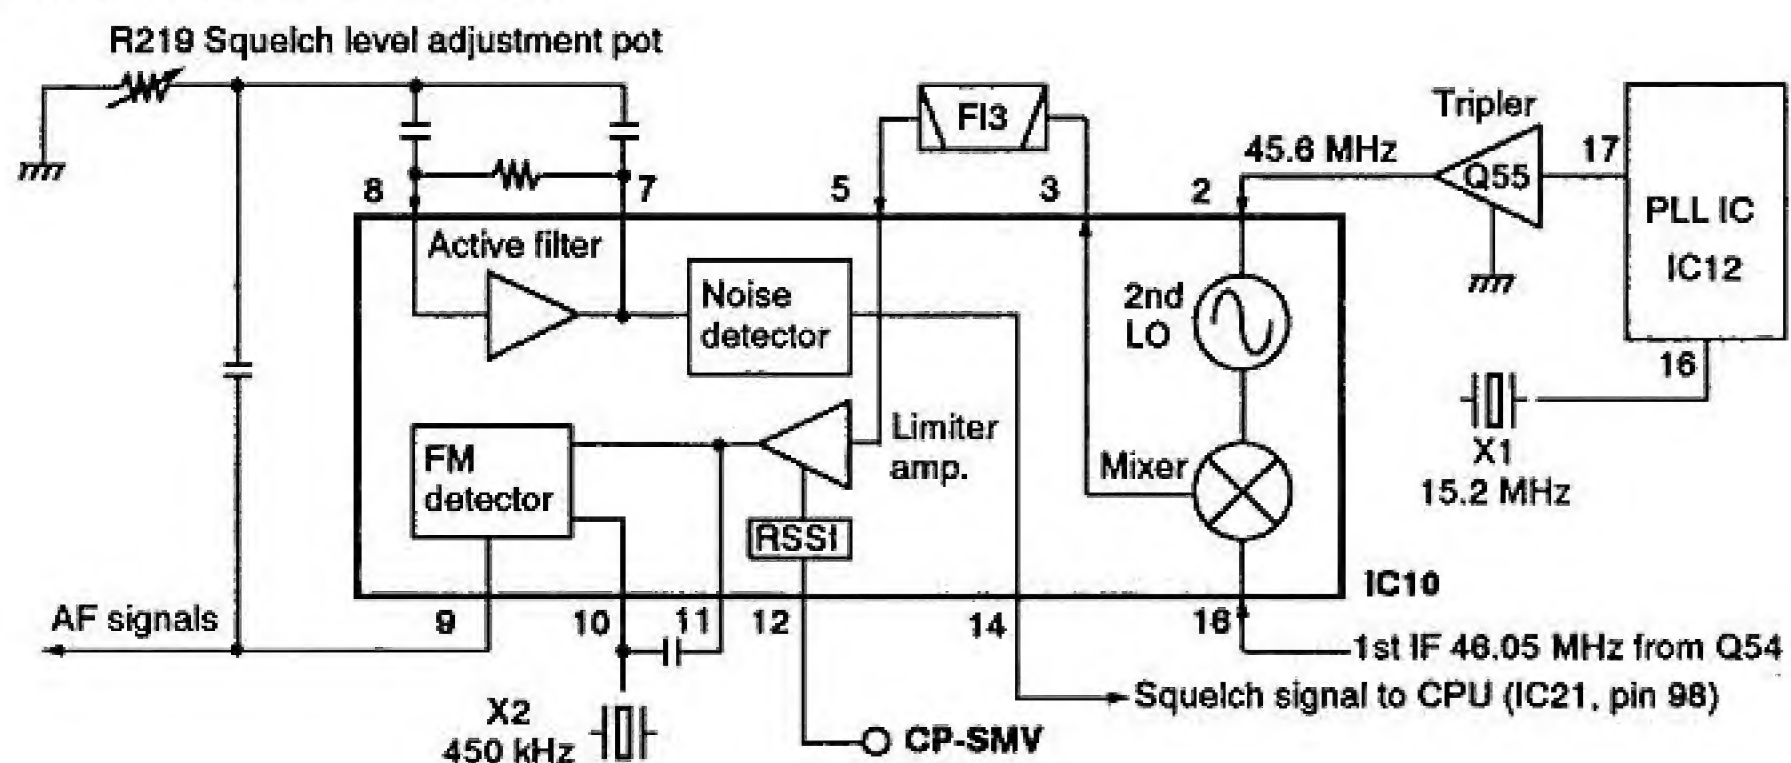

4-1-7 2ND IF AND DEMODULATOR CIRCUITS

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The FM IF IC (IC10) contains the 2nd local oscillator, 2nd mixer, limiter amplifier, quadrature detector, and s-meter detector circuits, etc.

The 1st IF signal from Q54 is applied to the 2nd mixer section of IC10 (pin 16), and is mixed with the 45.6 MHz 2nd LO signal generated by the tripler circuit (Q55) to produce the 450 kHz 2nd IF signal.

2ND MIXER AND DEMODULATOR CIRCUITS

The 2nd IF signal from IC10 (pin 3) is passed through the ceramic filter (FI3), where unwanted signals are suppressed, and is then applied to the 2nd IF and limiter amplifiers in IC10 (pin 5). The signal is applied to the FM detector section in IC10 for demodulation into AF signals.

The FM detector circuit employs a quadrature detection method (linear phase detection), which uses a ceramic discriminator (X2) for phase delay to obtain a non-adjusting circuit. The detected signal from IC10 (pin 9) is applied to the AF circuit and DIN connector (J3, pin 4) for data operation through the DATAOUT line.

4-1-8 AF AMPLIFIER CIRCUIT

The AF amplifier circuit amplifies the detected signals to drive a speaker. The AF circuit includes an AF mute circuit for the squelch.

AF signals from IC10 (pin 9) pass through the squelch mute switch (Q58), and are then applied to the active filter (Q57, Q56) which functions as a high-pass filter to subaudible tone signals for tone squelch operation.

The filtered signals pass through the volume control IC (IC5) and are then applied to the AF power amplifier (IC4, pin 1) via the AF mute switch (Q22). The amplified signals from IC4 (pin 4) drive the internal speaker (SP1) when no plug is connected to the [EXT EP] jack (J2).

4-1-9 SQUELCH CIRCUIT

A noise squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signal, the squelch circuit switches the squelch mute and AF mute switches.

Some of the noise components in the AF signals from IC10 (pin 9) are passed through the active filter (IC10, pins 8, 7), and then applied to the noise detector section. The variable resistor (R219) adjusts the input level of the active filter, and the level is used for squelch threshold reference. The detected noise signals are applied to the CPU (IC1, pin 98) via the SQLS line.

The [SQL] (CONTROL unit; R39) controls the input level of the sub-CPU (CONTROL unit; IC1, pin 8) in DC voltage. The sub-CPU reads the angle of the [SQL] rotation, then sends the squelch data to the CPU incorporated in the RDATA line. The CPU then controls the squelch mute (Q58) and AF mute (Q22) switches via the DMUT and AMUT lines, respectively.

4-1-10 UHF RF AND UHF 1ST MIXER CIRCUITS

The UHF RF signals are passed through part of a duplexer (high-pass filter; L20, L21, C75–C77). The signals are again passed through the low-pass filter (L22, L23, C78), antenna switching circuit (D15, D21–D23), and then amplified at the RF amplifier (Q12). A bandpass filter (FI1) is used at the next stage of the RF amplifier. The RF switch (D24, D25) turns on the UHF RF circuit when a UHF signal is received.

The filtered signals from the bandpass filter (FI1) are mixed with a 1st LO signal at the mixer circuit (Q13) to produce a 46.05 MHz 1st IF signal. The 1st LO signal is the PLL output frequency which comes from the U-VCO circuit (Q33, Q34).

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT

The microphone amplifier circuit amplifies audio signals from the microphone or the DIN connector to a level needed at the modulation circuit. The microphone amplifier circuit is commonly used for both the VHF and UHF bands.

The AF signals from the microphone are adjusted to match impedance at the MIC sensitivity switching circuit (IC28, D123). The adjusted AF signals (or 1200 bps packet signals from the DIN connector) pass through the MIC mute switch (Q75) and are then amplified at the microphone amplifier (Q72). The amplified signals are applied to the IDC amplifier (IC14b, pin 6) to control the maximum deviation. The output signals from the IDC amplifier (IC14b, pin 7) are passed through the splatter filter (IC14a, pin 3, 1) and then applied to each VCO circuit via the deviation adjustment pot.

The 9600 bps packet signals from the DIN connector (J3, pin 1) pass through the modulation switch (Q76, Q77) and are then applied to the buffer amplifier (IC13b). The amplified signals are then applied to the VCO circuit.

When 9600 bps packet signals are over-modulated, the 9600 bps limiter (IC13a) outputs a low level signal from pin 1 and the output signal is applied to the CPU (IC 21, pin 13) to stop transmission.

4-2-2 VHF MODULATION CIRCUIT

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

Audio signals from IC14a pass through the frequency deviation control (R158), are then applied to the modulation circuit (D31) via the V-MOD mute switch (Q39) to change the reactance of D31, and modulate the oscillated signal at the V-VCO circuit (Q30, Q31). The VCO output is buffer-amplified at Q29 and Q27, and is then applied to the band switching circuit (D30).

4-2-3 VHF DRIVE AMPLIFIER CIRCUIT

The drive amplifier circuit amplifies the VCO oscillating signal to a level needed at the power amplifier.

The signals from the band switch (D30) pass through the low-pass filter (L49, C188, C189) and T/R switch (D6), and are then applied to the attenuator (R12–R14). The transmit signal from the attenuator is amplified at the pre-drive (Q2) and drive (Q1) amplifiers to obtain an approximate 26 dBm signal level. The amplified signal is then applied to the RF power amplifier (IC1).

4-2-4 VHF POWER AMPLIFIER CIRCUIT

The power amplifier circuit amplifies the driver signal to an output power level.

IC1 is a power module which has amplification output capabilities of about 60 W. The RF signal from the drive amplifier (Q1) is applied to IC1 (pin 1). The amplified signal from the power amplifier (IC1, pin 4) is passed through the antenna switching circuit (D1) and is then applied to the antenna connector via a low-pass filter (L1–L3, C1–C3).

4-2-5 APC CIRCUIT

The APC circuit protects the power module (IC1: VHF, IC3: UHF) and drive amplifier (Q1: VHF, Q9: UHF) from a mismatched output load and stabilizes transmit output power.

The APC detector circuit (D2 and D3: VHF, D16 and D17: UHF) detects forward signals and rectified signals respectively. The combined voltage is at a minimum level when the antenna is matched at 50 Ω and increases when it is mismatched. The combined voltage is applied to the APC amplifier (IC2, pin 3) and compared with a reference voltage which is supplied from the CPU (IC21, pins 68–75) as the POWC signal.

The output voltage from the APC amplifier (IC2, pin 4) is applied to the APC control circuit (Q6–Q8) to control the bias voltage of the PA module (IC1: VHF, IC3: UHF) and drive amplifier (Q1: VHF, Q9: UHF).

4-2-6 UHF MODULATION CIRCUIT

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

Audio signals from IC14a pass through the frequency deviation control (R161), are then applied to the modulation circuit (D126) via the U-MOD mute switch (Q40) to change the reactance of D126, and modulate the oscillated signal at the U-VCO circuit (Q34, Q35). The VCO output is buffer-amplified at Q33 and Q27, and is then applied to the V/UHF switching circuit (D30).

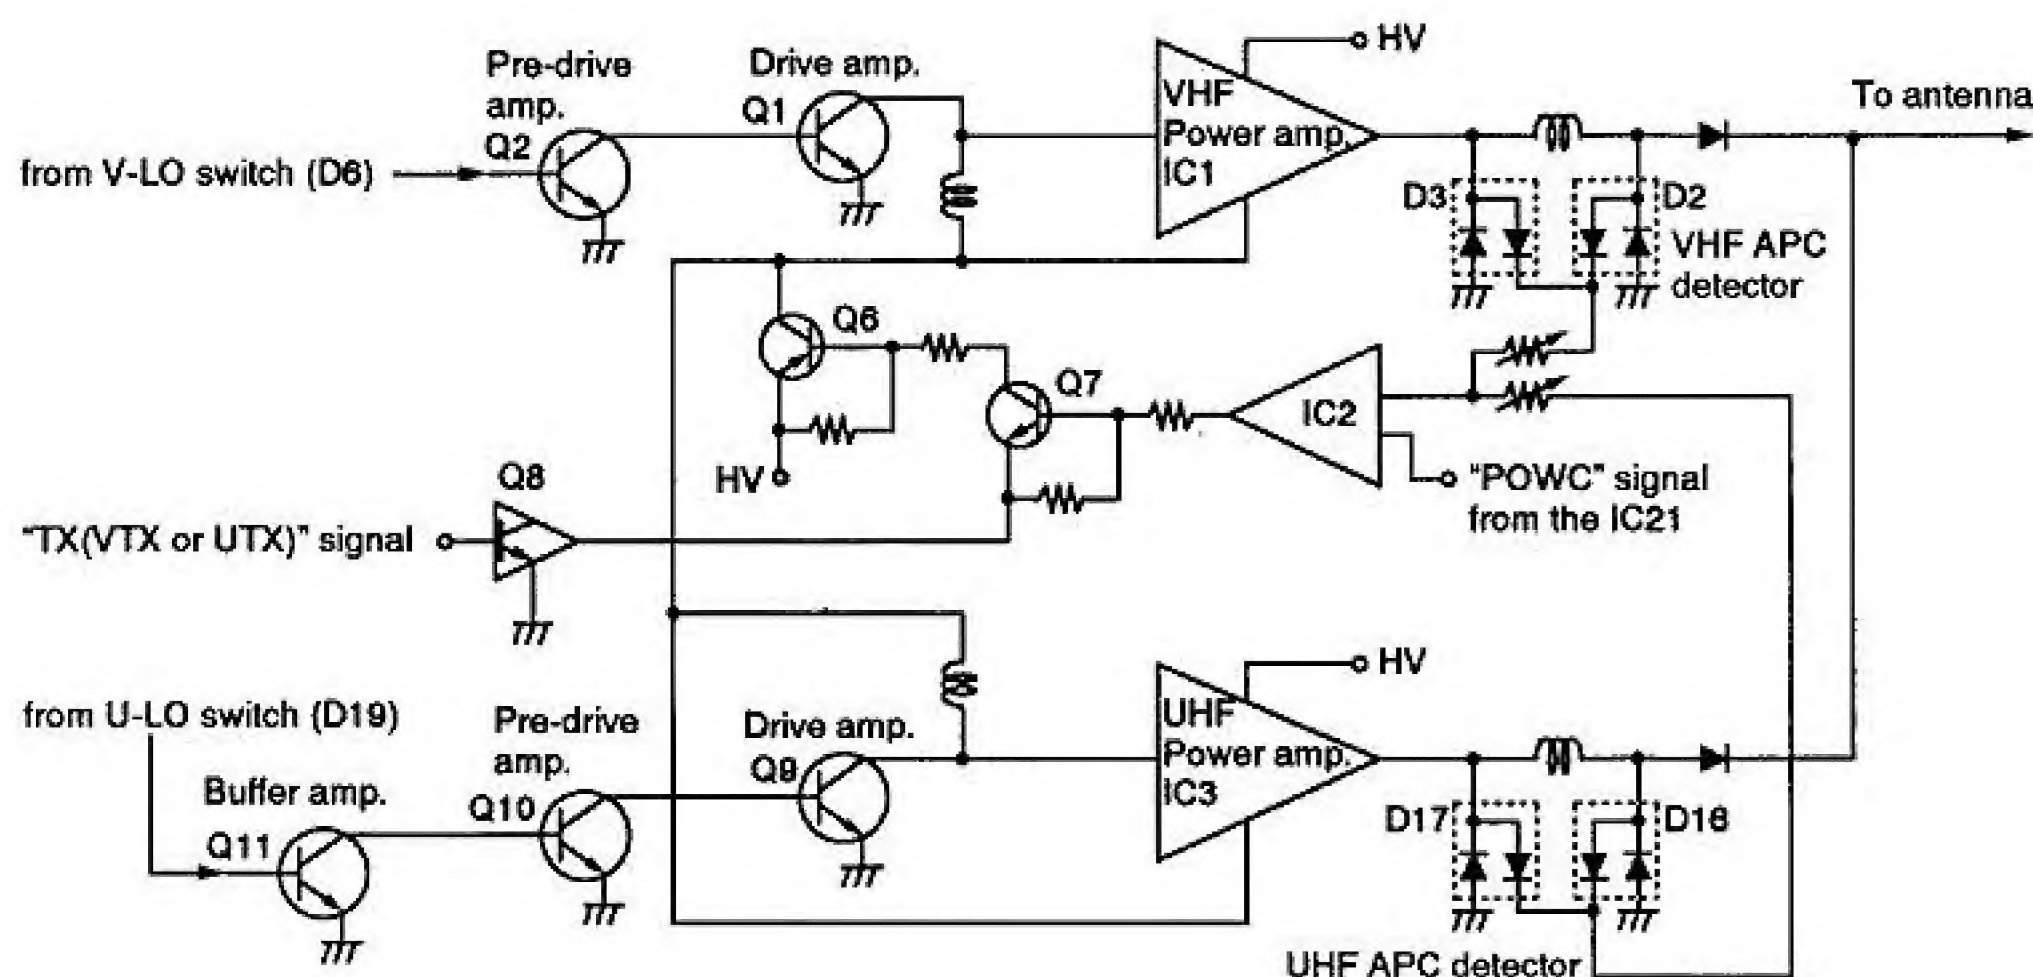

4-2-7 UHF DRIVE AND POWER AMPLIFIER CIRCUITS

The switched signal from the band switch (D30) is amplified at the buffer, pre-drive and the drive amplifiers (Q11, Q10, Q9) after being passed through the low-pass filter (L61, C111, C112) and T/R switch (D19). Then the amplified signal is applied to the UHF power amplifier circuit.

The drivers (Q9, Q10) obtain an approximate 26 dBm signal level.

The amplified signal from the drive amplifier (Q9) is applied to pin 5 of the power amplifier which has amplification output capabilities of about 40 W. The power amplified signal is output from pin 1 and then applied to the antenna connector via the antenna switching circuit (D15) and bandpass filter (L20–L23, C75–C78).

APC CIRCUIT

4-3 PLL CIRCUITS

4-3-1 GENERAL

A PLL circuit provides stable oscillation of the transmit frequency and the receive local frequency. The PLL circuit compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by a crystal oscillator and the divided ratio of the programmable divider. IC12 is a dual PLL IC which controls VCO circuits for both VHF and UHF.

4-3-2 VHF LOOP

The generated signal at the V-VCO (Q30, Q31, D31) enters the PLL IC (IC12, pin 2) via buffer-amplifiers (Q29, Q28), is divided at the programmable divider section and is then applied to the phase detector section.

The phase detector compares the input signal with a reference frequency, and then outputs the out-of-phase signal (pulse-type signals) from pin 8.

The pulse-type signal is converted into DC voltage (lock voltage) at the loop filter (R172, R178, C252), and then applied to the V-VCO to stabilize the oscillated frequency.

The lock voltage is also applied to the RX tunable bandpass filter as the tuning signal via the DC amplifier circuit (IC29, D129).

4-3-3 UHF LOOP

The generated signal at the U-VCO (Q34, Q35, D33) enters the PLL IC (IC12, pin 2) via buffer-amplifiers (Q33, Q28), is divided at the programmable divider section and is then applied to the phase detector section.

The phase detector compares the input signal with a reference frequency, and then outputs the out-of-phase signal (pulse-type signals) from pin 8.

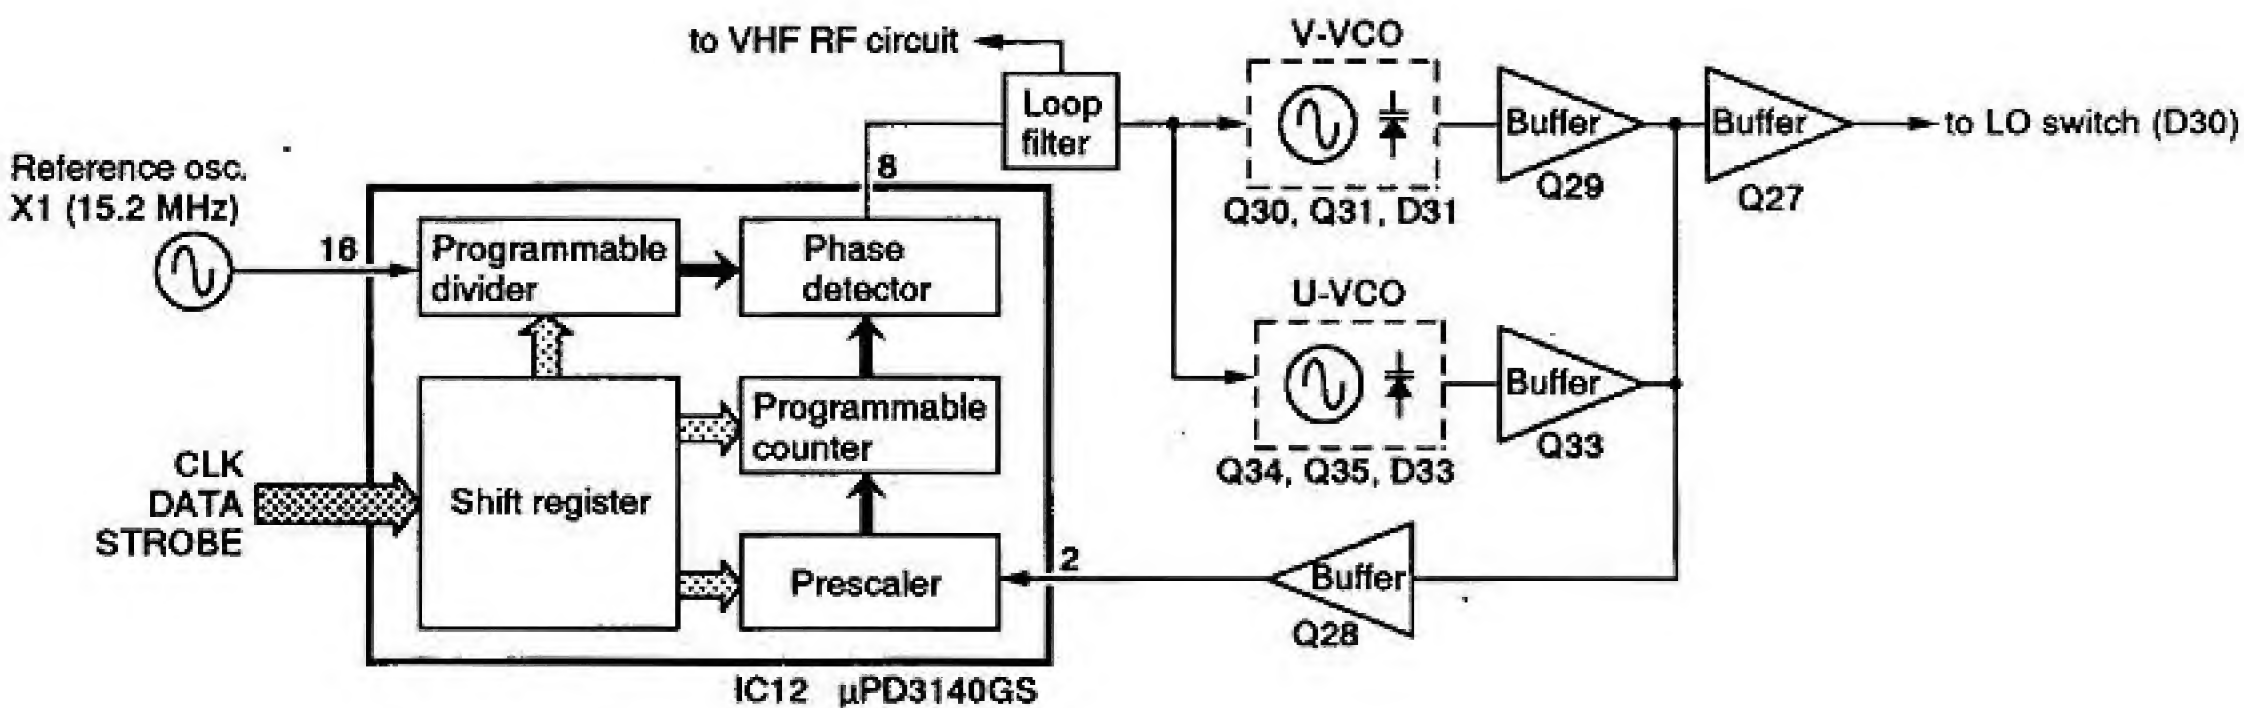

The pulse-type signal is converted into DC voltage (lock voltage) at the loop filter (R172, R178, C252), and then applied to the U-VCO to stabilize the oscillated frequency.

4-4 POWER SUPPLY CIRCUITS

4-4-1 VOLTAGE LINE

Line	Description
HV	The 13.8 V external DC power from the power connector.
13.8 V	The same voltage as the HV line which is controlled by the power switching circuit (Q25, Q26). When the [PWR] switch is pushed, the CPU outputs the control signal to the power switching circuit to turn the circuit ON.
8 V	Common 8 V converted from the 13.8 V line at the 8 V regulator circuit (IC8).
6 V	Common 6 V converted from the 13.8 V line at the 6 V regulator circuit (IC7, D29).
CPU5V	Common 5 V for the CPU produced at the CPU5V regulator circuit (IC6). The circuit outputs the voltage regardless of the power ON/OFF condition.
PLL5V	Common 5 V for PLL circuits produced from the CPU5V at the PLL 5V regulator circuit (Q45, Q46) using a control signal from the 8 V line.
VT8V	8 V for VHF transmitter circuits converted from the 8 V line at the VT8V regulator circuit (Q37, Q38).
UT8V	8 V for UHF transmitter circuits converted from the 8 V line at the UT8V regulator circuit (Q52, Q53).
RX8V	8 V for common receiver circuits produced from the 4R8V and 1R8V line at the RX8V switching circuit (D41).

PLL CIRCUIT

4-5 PORT ALLOCATIONS

4-5-1 CPU (MAIN unit IC21)

Pin number	Port name	Description
1	TONEIN	Input port for CTCSS decoded signals.
9	RES	Input port for the reset circuit signals.
12	FANC	Outputs cooling fan control signal. High: Fan activates
13	LIMIT	Input port to detect over modulation for packet transmission. Low: Over modulation
16	RDATA	Input port for serial signal from the sub-CPU (CONTROL unit, IC1).
17	TDATA	Output port for serial signal from the sub-CPU (CONTROL unit, IC1).
22	EXTMIC	Input port to detect optional wireless microphone (HM-90) connection. Low: HM-90 is connected
23	MICIN	Input port for microphone serial signal via the buffer-amp.
24	PTTP	Input port for packet PTT signal. High: Packet PTT switch is ON
25	E-TONE	Outputs 1750 Hz Europe tone signal.
26	PTTM	Input port for PTT switch.
33—35	ISTB2—ISTB0	Output port for initial matrix.
36—39	INI0—INI3	Input ports for initial matrix.
40	STBPL	Outputs strobe signals for PLL circuit.
41	SCK	Outputs clock to PLL.
42	SDATA	Outputs data signal to PLL.
43	UNLK	Input port for PLL unlock signal. High: PLL unlock
44	ESI	Input port for serial signal from EEPROM IC (IC25).
45	ESO	Output port for serial signal to EEPROM IC (IC25).
46	ECK	Outputs clock signal for the EEPROM IC (IC25).
48	AMUT	Outputs AF mute switch (Q22) control signal. High: During squelched
49	DMUT	Outputs squelch mute switch (Q58) control signal. High: During squelched

Pin number	Port name	Description
50	MMUT	Outputs MIC mute switch control signal. High: Microphone audio is muted
51	DTMUT	Outputs DTMF mute signal. High: DTMF signals are muted
52	UTX	Output UT8V regulator (Q52, Q53) control signal. High: While transmitting on UHF band
53	VTX	Output VT8V regulator (Q38, Q37) control signal. High: While transmitting on VHF band
54	1RX	Outputs 1RX-BIAS selector (Q64, Q68) control signal. High: During RX on VHF band.
56	4RX	Outputs 4RX-BIAS selector (Q65, Q68) control signal. High: During RX on UHF band.
59	PCTRL	Outputs power switching circuit control signal. High: While turning power ON
60	VCOS	Outputs shift signal for V-VCO circuit.
61	UVC0V	Outputs U-VCO 8 V switch (Q41, Q43) control signal.
62	VVC0V	Outputs V-VCO 8 V switch (Q42, Q43) control signal.
64—67	ATTC0—ATTC3	Output squelch attenuator control signal.
68—75	LPOC0—LPOC7	Output port for output power control signal.
77—84	VOLC0—VOLC7	Output volume level signals.
90	CTCSS	Outputs CTCSS tone signals.
91	DTMFE	Output port : DTMF signals while transmitting. : Beep audio signals while receiving.
98	SQLS	Input port for noise signals.
99	SMET	Input port for S-meter level signal.
100	MU/D	Input port for up/down signal from a microphone. 0 V: [UP] 0.45 V: [DN]
